## "Getting Pushy" Newton's Second Law of Motion

Purpose: To explore and use the relationship betwe enforce, mass and acceleration and to investigate the amount of acceleration or an object when a net force is acting on it.

Procedure:

1. Mark off $0 \mathrm{~m}, 5 \mathrm{~m}, 10 \mathrm{~m}$, and 15 m intervals with tape on the floor.
2. One person will pull the skater with a constant force shown by the spring scale when the skater holds one end and the puller holds the other. Another person must hold the skater from befind to keep fim from being pulled away from the 0 m mark Gefore the timer is ready. It is very important for the force to be constant and enough to overcome friction! Do not Pull harder to "get going".
3. Time the skater to the 5 m mark. Stop and go back to the start and time the skater to the 10 m mark, and thengo back and do the same for 15 m . Keeping the same force for all three distances. Record the force used and the time in Data $\mathcal{T} a b l e 1$.
4. Decide on a different force to use and repeat step 3 using this new constant force. Record $\mathcal{T}$ fis force and the time in data table 2.
5. Switch to a newskater that has a different mass than the first and repeat steps 3 \& 4 with The new skater.
6. Calculate the speed for each trial and record it in the calculations table.

Data Table 1

| S Kater \# 1 <br> ( Name) | Distance (m) | Force (N) | Time (s) |
| :---: | :---: | :---: | :---: |
|  | 5.0 |  |  |
|  | 10.0 |  |  |
|  | 15.0 |  |  |
|  | 5.0 |  |  |
|  | 10.0 |  |  |
|  | 15.0 |  |  |

Data Table 2

| Trial | Distance (m) | Force ( $N$ ) | Time (s) |
| :---: | :---: | :---: | :---: |
| SKater \# 1 | 5.0 |  |  |
|  | 10.0 |  |  |
| SKater \#2 | 15.0 |  |  |
|  | 5.0 |  |  |
|  | 10.0 |  |  |
|  | 15.0 |  |  |

Calculations Table: $\mathcal{V}=d / t$

| Trial Data 1 | Distance (m) | Speed <br> $(\mathrm{m} / \mathrm{s})$ |
| :---: | :---: | :---: |
| Skater 1 | To 5.0 m |  |
|  | 10.0 |  |
|  | 15.0 |  |
| SKater 2 | To 5.0 |  |
|  | 10.0 |  |
|  | 15.0 |  |

| Trial Data 2 | Distance (m) | Speed <br> $(\mathrm{m} / \mathrm{s})$ |
| :---: | :---: | :---: |
| SKater 1 | To 5.0 |  |
|  | 10.0 |  |
|  | 15.0 |  |
| SKater 2 | To 5.0 |  |
|  | 10.0 |  |
|  | 15.0 |  |

Analys is:

1. Does your experience and data in this lab show that $\mathcal{N e}$ wton was correct or not? Ulse an example from your lab to show that it is correct.
2. What happens to the speed as the skater went farther?
3. What was the main problem that you had to overcome?
4. Until the time of Galileo and $\mathcal{N}$ (ewton, people thought that a constant force was required to produce a constant speed. Do your observations confirm or reject this idea? Ulse an example to explain.
5. Suppose you applied a $5 \mathfrak{N}$ force and the skater did not move. How would you explain this?
6. When the force is the same and the mass is greater, what happens too the speed reached by the skater?
7. When the force is greater and the mass is the same, what fiappens to the speed reached by the SKater?
